Things completed last week:
- Backend met on Friday and allocated tasks (see "Back-End Meeting #1" in folder)
- Miranda completed general css and markup for the dashboard
    - next steps would be to integrate javascript and connect it
- Christian made the login/signup buttons function and expanded the general homepage (first draft of a finished product) – might need some refining
- Catherine completed the sign up and log in
    - it is interactable, but she is having javascript issues with what the user inputted (maybe because of an async call problem?); will create issue & assign Billy

Things discussed today and for next time:
- Queries
    - will be done by thursday (hopefully)
    - queries will be put in the queries directory on the backend
- "general-homepage-mockup"
    - Christian will create a pull request
    - Miranda will go into the branch and double check description and change the css
    - Then, Heman will review and merge
    - This should be done by the next scrum (Thu)
- Database Discussion:
    - Reservations:
        - take items less than or equal to the items there
    - if an admin were to be able to cancel reservation somehow those items will go back in or however many that is however many items that were they can cancel it
    - Should we change the status of reservations to completed and canceled?
        - User and admin will be able to make a distinction between whether or not the user has returned the item or canceled the item
        - Front-end will change how the status might change accordingly:
            - reserved/checked out
            - completed
            - canceled
